HMS Web Version System Design

1. Functional Specifications
2. System Architecture
3. Database Design
4. API Design
5. Security
6. DevOps & Deployment
7. Scaling & Performance Optimization
8. Testing & Code Management

Note: I think if they create the Figma design based on our requirements, you can review it, make corrections, and approve it. This will help them understand the business logic better, and the work will move faster.

It's important to complete the Figma design for the whole project first. Without a clear design concept, the database design may not be done properly. Frequent changes could delay the project and increase costs.

So, we should focus on system design first, then Figma design to keep the project well-structured and efficient.
